# Experiment

# 1.1 + 1.2: Libraries + experiment

---

```
# load libraries
library(Biobase)
library(lattice)
library(longitudinal)
library(rags2ridges)
library(ragt2ridges)
library(SparseTSCGM)

# load data
data(hpvP53)

# reformat data
Y <- longitudinal2array(t(exprs(hpvP53rna)))

# zero center data, variate- and cell line-wise
Y <- centerVAR1data(Y)
```

## 1.3: Data exploration

---

```
# plot time-courses of all variates
plotVAR1data(Y)

# plot time-courses of a single variate
plotVAR1data(Y[5, , , drop=FALSE])

# K-means clustering of the variates
cellLine <- 1
kClust    <- kmeans(Y[, , cellLine],
                    centers=7, nstart=100)$cluster

# heatmap of reshuffled data
edgeHeat(Y[unlist(lapply(1:max(kClust),
                        function(id, clusters){ which(clusters==id) },
                        kClust))), , cellLine])

# plot time-courses of smallest cluster
plotVAR1data(Y[kClust==which.min(table(kClust)), , ,
              drop=FALSE])
```

# Aim + model

VAR(1) model:

$$\begin{aligned} Y_{1,t+1} &= \dots + e_{1,t} \\ Y_{2,t+1} &= a_{21} Y_{1,t} + e_{2,t} \\ Y_{3,t+1} &= a_{31} Y_{1,t} + a_{32} Y_{2,t} + e_{3,t} \end{aligned}$$

where:

$$Y_1 \leftrightarrow \text{P53}; \quad Y_2 \leftrightarrow \text{IGF1}; \quad Y_3 \leftrightarrow \text{BBC3}$$

Unrolled:

Curled up:

# Model

VAR(1) model:

$$\mathbf{Y}_{1,t+1} = \quad \quad \quad + \mathbf{e}_{1,t}$$

$$\mathbf{Y}_{2,t+1} = a_{21} \mathbf{Y}_{1,t} \quad \quad + \mathbf{e}_{2,t}$$

$$\mathbf{Y}_{3,t+1} = a_{31} \mathbf{Y}_{1,t} + a_{32} \mathbf{Y}_{2,t} + \mathbf{e}_{3,t}$$

where:

$$\mathbf{Y}_1 \leftrightarrow \text{P53}; \quad \mathbf{Y}_2 \leftrightarrow \text{IGF1}; \quad \mathbf{Y}_3 \leftrightarrow \text{BBC3}$$

In matrix notation:

$$\mathbf{Y}_t = \mathbf{A} \mathbf{Y}_{t-1} + \boldsymbol{\varepsilon}_t$$

$$\text{with } \boldsymbol{\varepsilon}_t \sim \mathcal{N}(\mathbf{0}_{p \times 1}, \boldsymbol{\Omega}_{\varepsilon}^{-1})$$

$\mathbf{A}$  and  $\boldsymbol{\varepsilon}$ : propagation of endo- and  
exogenous signal, resp.  
 $\boldsymbol{\varepsilon}$  : innovation of the system.

Parameters as heatmap:

# Model

VAR(1) model:

$$Y_{1,t+1} = + e_{1,t}$$

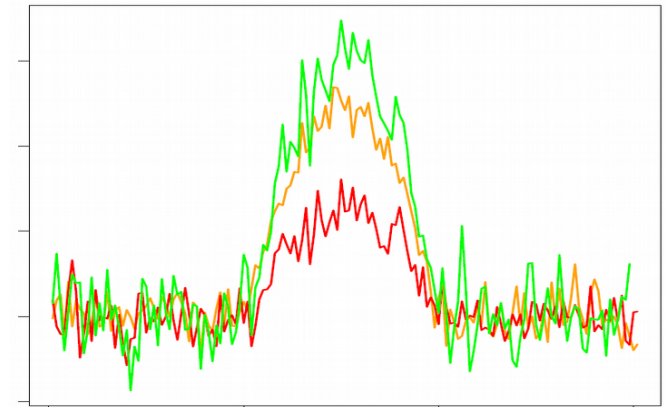

$$Y_{2,t+1} = a_{21} Y_{1,t} + e_{2,t}$$

$$Y_{3,t+1} = a_{31} Y_{1,t} + a_{32} Y_{2,t} + e_{3,t}$$

exogenous pulse

Coherent feed forward loop:

Incoherent feed forward loop:

# TSCG

Time Series Chain Graph (TSCG)  
→ conditional (in)dependencies

Temporal CI:

$$Y_{j_1,t} \perp\!\!\!\perp Y_{j_2,t+1} \mid \text{other } Y_{j,t}'\text{'s}$$

Example:

- CI: **BBC3** & **P53** (*no edge*)
- not CI: **P53** & **IGF1** (*directed edge*)

Contemporaneous CI:

$$Y_{j_1,t} \perp\!\!\!\perp Y_{j_2,t} \mid Y_{j,t-1}'\text{'s}, \text{ other } Y_{j,t}'\text{'s}$$

Example:

- CI: **BBC3** & **IGF1** (*no edge*)
- not CI: **P53** & **IGF1** (*undirected edge*)

# TSCG

TSCG harbors global  
conditional (in)dependencies:

$$Y_{j_1,*} \perp\!\!\!\perp Y_{j_2,*} \mid \text{other } Y_{j,*} \text{'s}$$

Wermuth condition for CI:  
unconnected nodes may not exert  
influence on the same node.

CI of nodes 1 and 4 forbids motifs:

# Estimation

Augment log-likelihood  
with ridge penalty:

$$\lambda_a \|\mathbf{A}\|_2^2 + \lambda_\omega \|\boldsymbol{\Omega}_\varepsilon\|_2^2$$

Include targets.

Analytic estimators:

$$\text{vec}[\hat{\mathbf{A}}(\lambda_a)] = [\lambda_a \mathbf{I}_{p^2 \times p^2} + \hat{\boldsymbol{\Gamma}}(0) \otimes \boldsymbol{\Omega}_\varepsilon]^{-1} \text{vec}[\boldsymbol{\Omega}_\varepsilon \hat{\boldsymbol{\Gamma}}(-1)],$$

$$\hat{\boldsymbol{\Omega}}_\varepsilon(\lambda_\omega) = \left\{ \left[ \lambda_\omega \mathbf{I}_{p \times p} + \frac{1}{4} \mathbf{S}_\varepsilon^2 \right]^{1/2} + \frac{1}{2} \mathbf{S}_\varepsilon \right\}^{-1}.$$

Initiate and iterate.

Rewrite  $\text{vec}(\mathbf{A})$  for computational efficiency

## 1.4 + 1.5: Penalty + estimation

```
# find optimal penalty parameters
optLambdas <- optPenaltyVAR1(Y, lambdaMin =c(0.01, 0.00001),
                             lambdaMax =c(1000, 1))

# fit the model
VAR1hat <- ridgeVAR1(Y=Y, lambdaA=optLambdas[1],
                     lambdaP=optLambdas[2])

# extract parameter estimates
Ahat <- VAR1hat$A; Phat <- VAR1hat$P

# add row and column names
rownames(Ahat) <- colnames(Ahat) <- rownames(Phat) <-
  colnames(Phat) <- rownames(hpvP53rna)

# heatmap of estimate of A
edgeHeat(Ahat, main="ridge estimate of A")

# heatmap of partial correlation matrix estimate
edgeHeat(pcor(Phat), main="part. Cor. estimate", diag=FALSE)
```

# 1.6: Stability

# Homework: code takes too long for practical

# Support

## Known

Equality constraints for known absent temporal edges:

$$\max_{\{\mathbf{A}_c : \mathbf{C} \text{vec}(\mathbf{A}_c) = \mathbf{d}\}} \mathcal{L}^{\text{pen}}(\mathbf{Y}; \mathbf{A}_c, \mathbf{\Omega}_\varepsilon; \lambda_a, \lambda_\omega)$$

Analytic solution, efficiently evaluable.

Similarly for known absent contemporaneous edges.

## Infer

Sparsification by:

- empirical Bayes,
- largest elements.

# 1.7: Support determination + ...

```
# support determination of A
zerosA <- sparsifyVAR1(A=Ahat, SigmaE=symm(solve(Phat)),
                      threshold="localFDR", FDRcut=0.95,
                      statistics=FALSE, verbose=FALSE)$zeros

# support determination of precision matrix
zerosP <- sparsify(Phat, threshold="localFDR", FDRcut=0.95,
                  output="light", verbose=FALSE)$zeros

# format precision support
supportP <- support4ridgeP(zeros=zerosP, nNodes=nrow(Y))

# optimal penalty parameter determination
optLambdas <- optPenaltyVAR1(Y, lambdaMin=rep(10^(-5), 2),
                             lambdaMax=c(10, 0.1),
                             lambdaInit=c(5, 0.01),
                             zerosA=zerosA, zerosP=zerosP,
                             cliquesP=supportP$cliques,
                             separatorsP=supportP$separators,
                             zerosAfit="sparse")
```

## 1.8: Re-estimation

---

```
# re-fit the model
VAR1hat      <- ridgeVAR1(Y=Y, lambdaA=optLambdas[1],
                          lambdaP=optLambdas[2],
                          zerosA=zerosA,
                          cliquesP=supportP$cliques,
                          separatorsP=supportP$separators,
                          zerosP=zerosP, zerosAfit="sparse")

# extract parameter estimates
Ahat <- VAR1hat$A; Phat <- VAR1hat$P

# add row and column names
rownames(Ahat) <- colnames(Ahat) <- rownames(Phat) <-
  colnames(Phat) <- rownames(hpvP53rna)

# time-series chain graph
graphVAR1(Ahat, Phat, nNames=rownames(Ahat), type="TSCG",
          vertex.label.cex=0.5, vertex.label.font=1,
          vertex.size=4, edge.width=1.5)
```

# Application

HPV-induced oncogenesis

- P53 pathway,
- 64 genes,
- fit + LOOCV,
- sparsify A and ?,
- re-fit + LOOCV.

Biology

- P53 knocked-out by HPV:  
zero connections
- HPV-related IGF1/IGFBP3:  
many connections.

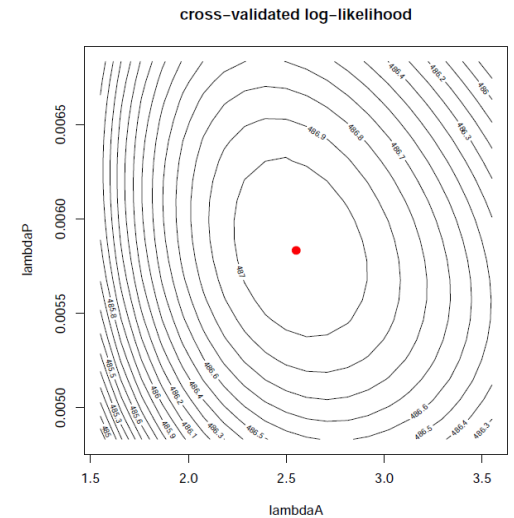

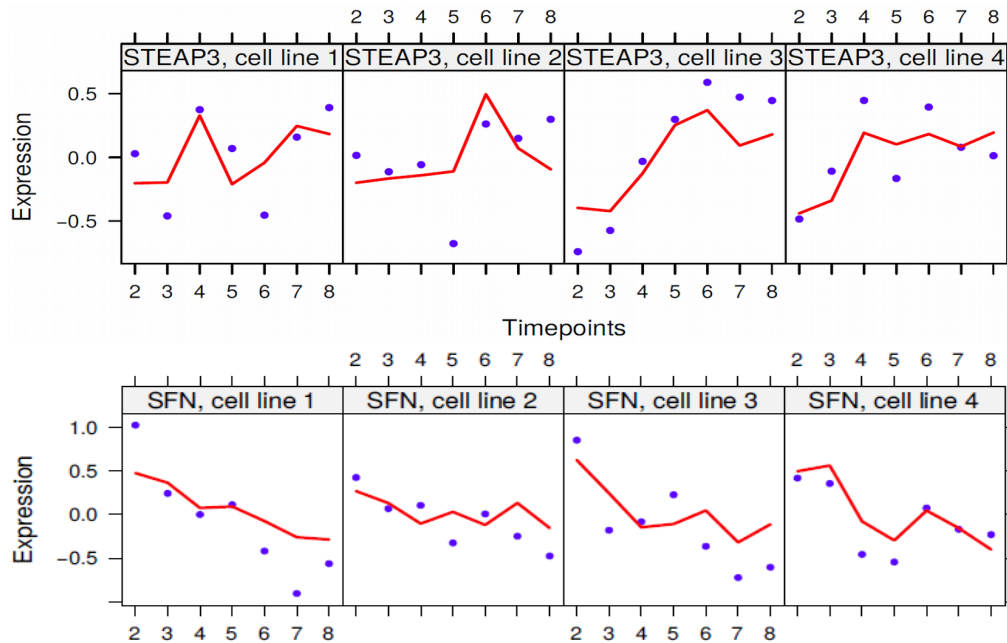

# Application

## Diagnostics

- LOOCV contourplot,
- fit vs. data.

# Application

Fit better than:

- Previous observation,
- Average other cell lines.

$r(Y_{\text{obs}}, Y_{\text{VAR1}})$

$r(Y_{\text{obs}}, Y_{\text{prev}})$

$r(Y_{\text{obs}}, Y_{\text{aver.}})$

## 1.9: Evaluate fit

---

```
# calculate fits and fit-vs-observation correlations
Yhat <- array(dim=dim(Y))
for (i in 1:dim(Y)[3]){
  Yhat[, -1, i] <- Ahat %**% Y[, -dim(Y)[2], i]
}

# calculate fits and fit-vs-observation correlations
for (i in 1:dim(Y)[3]){
  Yhat[, -1, i] <- Ahat %**% Y[, -dim(Y)[2], i]
}
corFit <- numeric()
for (j in 1:dim(Y)[1]){
  slHelper <- numeric()
  for (i in 1:dim(Y)[3]){
    slHelper <- c(slHelper, cor(Yhat[j, -1, i],
                                Y[j, -1, i], m="s"))
  }
  corFit <- rbind(corFit, slHelper)
}
hist(corFit, xlab="Correlation", ylab="Frequency", n=20)
```

# Application

## Node analysis

	$\text{deg}^-(\mathbf{A})$	$\text{deg}^+(\mathbf{A})$	between.	close.	eigen centr.

'regulator'

'regulatee'

# Downstream

---

## Mutual information.

A generalized 'correlation' measure, between a variate at some time and all variates at a future time point (given the past):

$$\begin{aligned}\mathcal{I}(\mathbf{Y}_{*,t+\tau}, Y_{j,t} \mid \mathbf{Y}_{*,t-1}) &= \mathcal{H}(\mathbf{Y}_{*,t+\tau} \mid \mathbf{Y}_{*,t-1}) \\ &\quad - \mathcal{H}(\mathbf{Y}_{*,t+\tau} \mid Y_{j,t}, \mathbf{Y}_{*,t-1})\end{aligned}$$

where:

$$\mathcal{H}(\mathbf{Y}_{*,t+\tau} \mid \mathbf{Y}_{*,t-1}) = \log \left( \left| \mathbb{V}(\mathbf{Y}_{*,t+\tau} \mid \mathbf{Y}_{*,t-1}) \right| \right)$$

E.g.:

'regulator' (deg<sup>+</sup>=17):

$$\rightarrow \mathcal{I}(\text{all}_{t+1}, \text{BBC3}_t \mid \dots) = 0.05605$$

'regulatee' (deg<sup>-</sup>=12):

$$\rightarrow \mathcal{I}(\text{all}_{t+1}, \text{CDKN2A}_t \mid \dots) = 0.00000$$

# Downstream

## Impulse response.

Assess the change in variates at future time points due to a change in a variate at the current time:

$$\frac{\partial \mathbf{Y}_{*,t+\tau}}{\partial \epsilon_{*,t}} = \mathbf{A}^{\tau}$$

Facilitates prediction of knock-out effect.

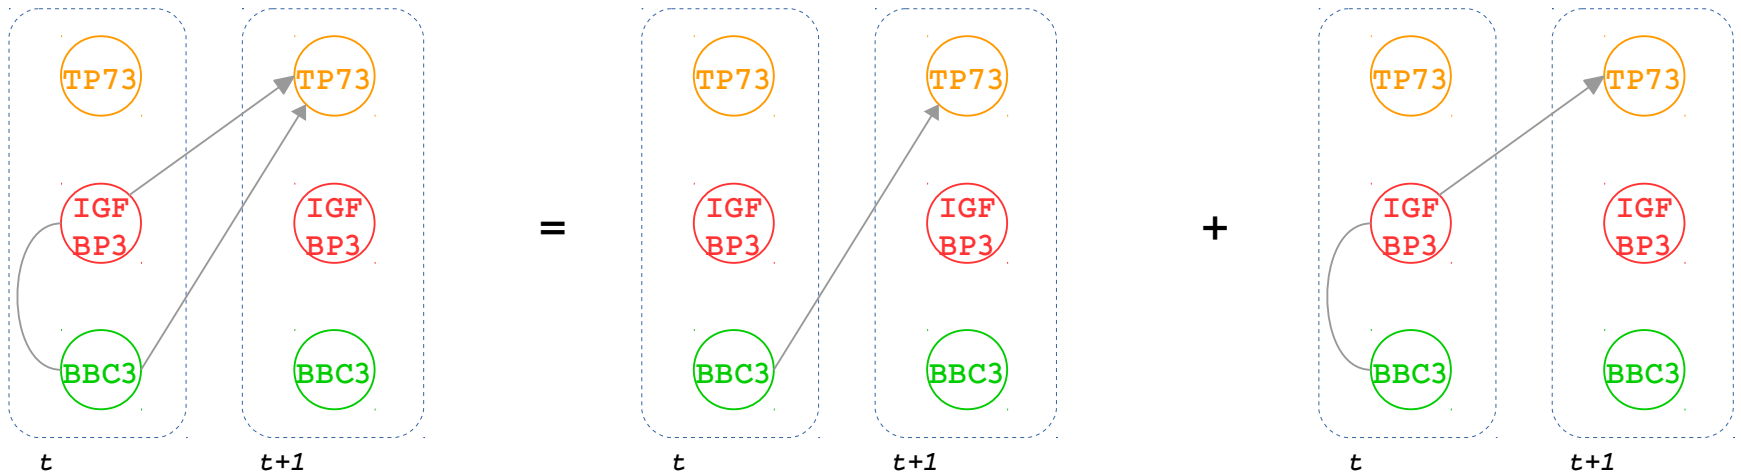

E.g.:

- 'regulator' ( $\text{deg}^+=17$ ): effect of  $\text{BBC3}_t$  on  $\text{all}_{t+1} = 0.01497$
- 'regulatee' ( $\text{deg}^-=12$ ): effect of  $\text{CDKN2A}_t$  on  $\text{all}_{t+1} = 0.00000$

# Downstream

## Covariance decomposition.

Given TSCG, decompose conditional covariance  
in terms of paths:

E.g.:

$\text{Cov}(\text{BBC3}_t, \text{TP73}_{t+1} \mid \dots) :$

$$-0.003168 = -0.002483 + -0.0006845$$

## 1.10: Down-stream analysis

---

```
# calculate node-wise network stats
nodeStats <- nodeStatsVAR1(Ahat, Phat, as.table=TRUE)

# show node degree table
print(nodeStats[, 1:7])

# specify time lag
lag <- 1

# evaluate mutual informations with specified lag
MIs <- mutualInfoVAR1(Ahat, solve(Phat), lag)

# evaluate impulse response with specified lag
IRs <- impulseResponseVAR1(Ahat, lag)
```

# 1.10: Down-stream analysis

# motif detection  
 motifStatsVAR1(Ahat)

# self-regulators: 2

# feedback-pairs: 0

# feedforward loops: 7

# feedback loops: 0

# bi-fans: 18

# diamonds: 6
